

## The 5 advantages of the esb panel at a glance:

### Better than OSB!

- Optimum board utilisation
- Transverse tensile strength 40% better than with OSB
- High dimensional stability when machining
- Top panel appearance
- Can be used as UDP-A according to ZVDH/Cologne

### Suitable for painting!

### Odour-neutral!

### Water vapour permeable!

### Good value!

elka-Holzwerke was founded in 1906 and is located in Morbach, Rhineland-Palatinate, in the middle of the extensive woodlands of the Hunsrück region. The fourth-generation family business has been committed to the topics of healthy living, emission reduction and sustainability for many years. Since August 2021, elka has been certified as a climate-neutral company (balance sheet, including CO<sub>2</sub> certificates).

Thanks to the exemplary value chain, almost all parts of the round wood used can be processed. Raw timber is exclusively sourced from suppliers who are committed to the sustainability principles of the Pan-European Forest Certification (PEFC) and FSC.

## The solution for healthy Building & Living

The 5 Advantages of an esb board

Fresh spruce wood goes into our esb. Smell the difference!

### Why is esb board better than an OSB board?

Thanks to good static (in accordance with DIN EN 12369 Part 1/DIN 20000-1) and technical values (in accordance with DIN EN 13986 and DIN EN 312), esb is suitable for floor construction, wall and roof cladding, construction fencing, shop and trade fair construction, interior fittings, statically effective ceilings, roofs and wall panels in timber frame construction and packaging.  
The technical properties in detail:

#### Flexural strength & modulus of elasticity:

The flexural strength and the modulus of elasticity of the **esb boards** are the same in both directions.  
With the OSB board, however, the value is halved in the transverse direction.

Advantage: This enables the craftsman to achieve the optimum panel yield when cutting.  
Processing errors due to confusion between the main and the minor axes are ruled out with the **esb board**.

#### Transverse tensile strength:

The transverse tensile strength is 40% better than that of an OSB board.

Advantage: This leads to better screw and nail pull-out values.

#### Swelling values:

The swelling values are significantly lower than with OSB boards.

Advantage: High dimensional stability during processing.

#### Excellent panel appearance with sanded surface:

The **esb board** has a very light surface and a clean appearance. Unique on the German market, it is made from domestic fresh wood. **esb boards** are delivered sanded.

Advantage: No finishing, no re-sanding.

### Is it possible to paint esb?

**Yes!** Since the **esb board** is basically sanded and has an almost dense surface, varnishes that are open to diffusion can be applied as well as paints or adhesives.

### Can the use of esb panels in the house result in cause odour nuisance?

**No!** The **esb board** is largely odourless and supports a healthy living climate.

OSB boards, on the other hand, can release volatile organic compounds such as hydrocarbons, aldehydes, acetone and organic acids into the indoor air under certain conditions. Odour nuisance, irritation of the mucous membranes and toxic long-term effects are listed as possible effects by the Federal Environment Agency's research project "Determination of VOC emissions from OSB boards-UMID 1 2013".

### What is the significance of the greatest possible diffusion openness of the esb panel?

Similar to the way heat always moves from the warm to the cold side, a balance also takes place between areas of different humidity. To ensure that this works perfectly, vapour retarders and our largely diffusion-open **esb boards** can be intelligently combined with each other if necessary. The latter prevents the formation of condensation and thus moisture-related structural damage.  
The **esb board** is a largely diffusion-open wood material that compensates for climate fluctuations in the house. The **esb board** has also proven its worth on exterior walls, e.g. as a support for a ventilated formwork or under a diffusion-open thermal insulation.

The **esb board** thus ensures moisture transport over the entire wall thickness and over the entire service life of the panel. If required, the **esb board** can be provided with a foil as a vapour barrier on the warmer side for a diffusion-sealed construction. This technology, proven over decades technology is used in the prefabricated house industry. For a structure without a vapour barrier, a building physics check of the selected structure is indicated.

### What does esb cost?

The brand product price of the **esb board** depends on the current timber prices and the quantity ordered. Thanks to its wide usage spectrum, esb can replace P2, P3, P5 particle board and OSB/2, OSB/3 in the timber trade as well vapor-permeable wood fibre panels.

**Now also as sarking board N+F according to ZVDH/Cologne**

## TO SUM UP: esb is a real all-rounder with many advantages!!

**esb boards** (P5) are manufactured in accordance with DIN EN 312. They can be supplied FSC® and PEFC-certification and are labelled with the CE mark.
